## Thanksgiving Quizz

Let N be a Poisson process with parameter 2, with  $N_t$  representing the number of neutrinos arrived in a neutrino detector between time 0 and time t weeks. Select the only right answer.

- 1. Which statement is the most true?
  - (a) N has independent and stationary increments
  - (b)  $N_t$  has a Poisson distribution for every  $t \ge 0$
  - (c) Both
- 2. What is the probability that, after one week of observation, exactly one neutrino has arrived in the detector?
  - (a)  $e^{-2}$  (b)  $2e^{-2}$  (b) 1
- 3. What is the expected number of neutrino that will arrive in the detector within two weeks time from today?
  - (a) 1 (b) 2 (c) 4
- 4. What is the expected number of neutrino that will arrive in the detector between January 1, 2027 (12am) and January 15, 2027 (12am)?
  - (a) 1 (b) 2 (c) 4
- 5. The arrival time of the  $10^{th}$  neutrino in the detector follows a
  - (a) Poisson (b) Exponential (c) Gamma

distribution.

- 6. The time between the arrival of the  $10^{th}$  neutrino and the arrival of the  $12^{th}$  follows a
  - (a) Gamma distribution with shape parameter 2 and rate parameter 2 (and mean 1)
  - (a) Exponential distribution with parameter 2 (and mean  $\frac{1}{2}$ )
  - (b) Exponential distribution with parameter 1 (and mean 1)
